

Operations Research

The book starts with basic topics, such as formulation and graphical solution of Linear Programming Problems (LPP), simplex and revised Simplex Method, duality and sensitivity analysis, transportation and assignment models, and then moves on to advance topics, such as sequencing and scheduling (CPM & PERT), dynamic, integer and goal programming, game and decision theories, queuing and replacement models, simulation, inventory (deterministic and probabilistic) models, non-linear programming, classical optimization techniques, etc. Further, seven appendices have been provided which discuss a few preliminary mathematical concepts in brief, and also provide a few tables that would be helpful in solving certain problems provided in the book.
