Perceptual Consequences of Cochlear Damage

Over the last decade, there has been a revolution in our understanding of the physiological role of the cochlea, and the mechanisms of cochlear hearing loss, the most common type of hearing loss in adults. This book is the first book covering this topic and aimed at the student and researcher working in the fields of psychophysics, audiology, and signal processing; the book covers the design of signal processing hearing aids. Readers in the field of auditory rehabilitation and its technology will also find this book very useful.

The main goal is to convey a general understanding of the perceptual changes associated with cochlear hearing loss, and of the difficulties faced by the hearing impaired person. The reader should come away with a impression not only of what happens, but also of why it happens.
