Editor-in-Chief: Sergey Foss

Queueing Systems

Theory and Applications

Queueing Systems: Theory and Applications (QUES) is a well-established journal focusing on the theory of resource sharing in a wide sense, particularly within a network context. The journal is primarily interested in probabilistic and statistical problems in this setting. QUES welcomes both papers addressing these issues in the context of some application and papers developing mathematical methods for their analysis. Among the latter, one would particularly quote Markov chains and processes, stationary processes, random graphs, point processes, stochastic geometry, and related fields. The prospective areas of application include, but are not restricted to production, storage and logistics, traffic and transportation, computer and communication systems.
