

Numerical Analysis and Optimization

An Introduction to Mathematical Modelling and Numerical Simulation

Based on the Author's teaching notes at the École Polytechnique, Numerical Analysis and Optimization familiarises students with existing mathematical models (often partial differential equations) and their methods of numerical solution and optimization. The role of modelling and scientific computing has increased dramatically over recent years, and new applications of mathematical models have emerged in Biology, Environmental Science, Finance, Medicine, and Social Science, as well as the classical applications in Chemistry, Mechanics and Physics. Including numerous exercises and examples, this is an ideal text for advanced undergraduates and graduates and researchers in Applied Mathematics, Engineering, Computer Science, and the Physical Sciences. Numerical Analysis and Optimization familiarises students with mathematical models (PDEs) and methods of numerical solution and optimization. Including numerous exercises and examples, this is an ideal text for advanced students in Applied Mathematics, Engineering, Physical Science and Computer Science.

This text, based on the author's teaching at École Polytechnique, introduces the reader to the world of mathematical modelling and numerical simulation. Covering the finite difference method; variational formulation of elliptic problems; Sobolev spaces; elliptical problems; the finite element method; Eigenvalue problems; evolution problems; optimality conditions and algorithms and methods of operational research, and including a several exercises throughout, this is an ideal text for advanced undergraduate students and graduates in applied mathematics, engineering, computer science, and the physical sciences.
