

Operationalized Psychodynamic Diagnosis OPD-2

OPD-2 – a new edition of the multi-axial diagnostic system for psychodynamically oriented therapists and psychiatrists, now with practical tools and procedures for treatment planning and for measuring change. Operationalized Psychodynamic Diagnosis (OPD) is a form of multi-axial diagnostic and classification system based on psychodynamic principles, analogous to those based on other principles such as DSM-IV and ICD-10. The OPD is based on five axes: I = experience of illness and prerequisites for treatment, II = interpersonal relations, III = conflict, IV = structure, and V = mental and psychosomatic disorders (in line with Chapter V (F) of the ICD-10). After an initial interview lasting 1–2 hours, the clinician (or researcher) can evaluate the patient's psychodynamics according to these axes and enter them in the checklists and evaluation forms provided. The new version, OPD-2, has been developed from a purely diagnostic system to include a set of tools and procedures for treatment planning and for measuring change, as well as for determining the appropriate main focuses of treatment and developing appropriate treatment strategies.
