

Robust Model-Based Fault Diagnosis for Dynamic Systems

There is an increasing demand for dynamic systems to become more safe and reliable. This requirement extends beyond the normally accepted safety-critical systems of nuclear reactors and aircraft where safety is paramount important, to systems such as autonomous vehicles and fast railways where the system availability is vital. It is clear that fault diagnosis (including fault detection and isolation, FDI) has been becoming an important subject in modern control theory and practice. For example, the number of papers on FDI presented in many control-related conferences has been increasing steadily. The subject of fault detection and isolation continues to mature to an established field of research in control engineering. A large amount of knowledge on model-based fault diagnosis has been accumulated through the literature since the beginning of the 1970s. However, publications are scattered over many papers and a few edited books. Up to the end of 1997, there is no any book which presents the subject in a unified framework. The consequence of this is the lack of "common language", different researchers use different terminology. This problem has obstructed the progress of model-based FDI techniques and has been causing great concern in research community. Many survey papers have been published to tackle this problem. However, a book which presents the materials in a unified format and provides a comprehensive foundation of model-based FDI is urgently needed.

Artikelnummer: 9781461373445

Medium: Buch

ISBN: 978-1-4613-7344-5

Verlag: Springer

Erscheinungstermin: 02.11.2012

Sprache(n): Englisch

Auflage: 1. Auflage 2012

Serie: The International Series on Asian Studies in Computer and Information Science

Produktform: Kartoniert

Gewicht: 575 g

Seiten: 356

Format (B x H): 155 x 235 mm
