Computational Methods for Nanoscale Applications

Particles, Plasmons and Waves

160,49 €
149,99 € (zzgl. MwSt.)

Lieferfrist: bis zu 10 Tage

This second edition of a well-received book presents new perspectives on modern nanoscale problems, where fundamental science meets technology and computer modeling. Along with traditional computational techniques such as finite-difference schemes, finite element analysis and Ewald summation, the book describes a new finite-difference calculus of Flexible Local Approximation MEthods (FLAME), which qualitatively improves the numerical accuracy in a variety of problems. Application areas in the book include long-range particle interactions in homogeneous and heterogeneous media, electrostatics of colloidal systems, wave propagation in photonic crystals, photonic band structure, plasmonic field enhancement, metamaterials, backward waves and negative refraction, cloaking, focusing beyond the diffraction limit, and transformation optics. The second edition incorporates new chapters on metamaterials and on the finite difference time domain method (FDTD), an exposition of absorbing boundary conditions, and *Miscellany* – a collection of paradoxical or controversial subjects related to the main topics of this book. A vast volume of material has been updated, revised or rewritten.

Computational Methods for Nanoscale Applications, Second Edition, is accessible to specialists and graduate students in diverse areas of nanoscale science and technology, including physics, engineering, chemistry, and applied mathematics. In addition, several advanced topics will be of interest to the expert reader.

Artikelnummer: 9783030438951
Medium: Buch
ISBN: 978-3-030-43895-1
Verlag: Springer
Erscheinungstermin: 22.08.2021
Sprache(n): Englisch
Auflage: 2. Auflage 2020
Serie: Nanostructure Science and Technology
Produktform: Kartoniert
Gewicht: 1095 g
Seiten: 707
Format (B x H): 155 x 235 mm
