

Implementing Distributed Systems with Java and CORBA

The book addresses readers that are interested in the design and development of distributed software systems relying on the Common Object Request Broker Architecture (CORBA). CORBA is an industry standard that has considerably changed the way that modern information systems are developed. It enables the platform-independent and programming-language-independent implementation of distributed object-oriented systems and supports the migration of legacy systems into modern architectures as well. The book is intended in particular for students of computer science and management information systems in their graduate studies as well as for practitioners and professional software developers that are looking for fast access to CORBA technology and want to profit from meaningful code examples. Three different ORBs, examples, and exercises with solutions are available for download.

This book provides graduate students and practitioners with knowledge of the CORBA standard and practical experience of implementing distributed systems with CORBA's Java mapping. With tested code examples that will run immediately!
