

Biominingalization II

Mineralization Using Synthetic Polymers and Templates

This series presents critical reviews of the present position and future trends in modern chemical research. The short and concise reports on chemistry are each written by world renowned experts. This series is still valid and useful after 5 or 10 years. More information as well as the electronic version of the whole content available at: springerlink.com.

epitaxial and non-epitaxial growth. Hiroaki Imai describes hierarchically structured crystals formed through self-organization in solution systems. A wide variety of complex morphologies including fibrils, dendrites, and self-similar structures are reviewed. Fluorapatite-gelatin nanocomposites, reviewed by Rüdiger Kniep and Paul Simon, are suited to obtaining deeper insight into processes of self-organization, and can help to learn about essentials in the formation of inorganic-organic nanocomposites of biological relevance.
