

Model Driven Architecture - Foundations and Applications

Third European Conference, ECMDA-FA 2007, Haifa, Israel, June 11-15, 2007, Proceedings

Model-driven architecture, and model-driven approaches in general, holds the promise of moving software development towards a higher level of abstraction. Given the challenges in the software industry of delivering more complex functionality with less effort, it is not really a question whether model-driven development will succeed, but rather a question of when it will break through. However, before this can happen, there are many challenging problems to conquer, both theoretical and pragmatic. This requires close collaboration between academic research and industrial application.

The goal of the European Conference on Model-Driven Architecture—Foundations and Applications (ECMDA-FA) is to bring together industry and academia to tackle the problems in model-driven development. This volume includes nine foundation papers and seven application papers. ECMDA-FA 2007

also hosted six workshops on both theoretical and practical aspects of MDA. Furthermore, the keynote speakers, Stuart Kent from Microsoft and Andy Schurr from TU Darmstadt, proved that both industry and academia are interested in MDA and its applications. This third ECMDA-FA conference is the result of the work of the authors who submitted a total of 60 papers, the Program Committee members who produced careful and thoughtful reviews under significant time pressures, the people organizing the workshops, and of course the Steering Committee. Several hundreds of people worked hard to make this conference a success. We have the honor of speaking for all these people in this preface and we would like to thank each of them for their valuable contribution. The ECMDA-FA 2007 conference was supported by the European Commission's Information Society Technologies (IST) initiative and by IBM.
