The Future of Work

Ethical Evaluation of the Change of Human Labor in the Context of Advancing Automation

Changes in the working world due to artificial intelligence and robots are a hot topic, yet well-founded answers from an ethical perspective are lacking. This book provides these in a scientific manner and is the result of a multi-year research project by the Universities of Lucerne and Yale. It discusses the opportunities and risks of automating human labor and provides policy recommendations to enable a dignified life. The author, Darius Meier, has been operating at the intersection of science, practice, and politics for years, which is why this book is aimed at those who are interested in ethical solutions to preserve social peace in the digital age.
