

Intelligent City Evaluation System

This book assesses various intelligent-city evaluation systems around the globe, and subsequently combines that assessment with local-government and enterprise practices to create an evaluation index system for quantifying the Intelligent City concept.

In addition, the book provides the results of the CityIQ indicator ranking of intelligent cities in China and worldwide, a system that focuses on three of the most crucial aspects of urban development: the development environment, future trends, and construction and operation. After data sorting, calculation and dimensionless treatment, a score system ranging from 0 to 100 is created for ranking and analyzing cities.

Providing unique strategies for promoting an intelligent city evaluation system, the book offers a valuable reference guide for intelligent-city decision-makers, as well as leaders in public urban economy, social welfare and environmental authorities.

For the first time, comprehensively analyzes and summarizes current intelligent city evaluation systems, and applies open data resources instead of traditional statistic data evaluation mode Provides the evaluation results with the CityIQ indicator ranking of intelligent cities in China and worldwide Covers five aspects of the cities with the indicator: environment and construction, management and service, industry and economy, hardware construction and literacy and education of citizens
