

The prime focus of Tectonophysics will be high-impact original research and reviews in the fields of kinematics, structure, composition, and dynamics of the solid earth at all scales. Tectonophysics particularly encourages submission of papers based on the integration of a multitude of geophysical, geological, geochemical, geodynamic, and geotectonic methods with focus on: • Kinematics and deformation of the lithosphere based on space geodesy (e.g. GPS, InSAR), neotectonic studies, tectonic geomorphology, and geochronology; • Structure, composition, and thermal state of the crust and mantle and their evolution in various time scales based on geophysical and geochemical studies; • Structural geology, folding, faulting, fracturing, analysis of stress and strain, and rock mechanics; • Orogenesis, tectonism, thermochronology, surficial processes, land-climate interactions, and Lithospheric-asthenospheric interactions; • Active tectonics, seismology, mechanisms of earthquakes and volcanism, geological hazards and their societal impacts; • Rheology and numerical modelling of geodynamic processes; • Laboratory measurements of physical and chemical parameters of crustal and mantle rocks, and their application to geophysics and petrology; • Innovative development, including testing, of new methods in geophysics and geodynamics.
