Elsevier Current Trends

Trends in Genetics

Trends in Genetics was launched in 1985 and quickly became a “must read” journal for geneticists, known for its concise, accessible articles on a range of topics from developmental biology to evolution. This tradition continues today, and TiG remains a favorite in the community for its distinctive content. As the field has changed, though, so too has the scope of the journal, which now encompasses new areas, such as genomics, epigenetics, and computational genetics, while continuing to cover traditional subjects like transcriptional regulation, population genetics, and chromosome biology. The core aim of the journal, however, is still to provide researchers and students with high-quality, novel reviews, commentaries, and discussions and, above all, to foster an appreciation for the advances being made on all fronts of genetic research.
